Attribute	Value
Experiment ID	11
Experiment Name	e2e_traffic_flood_test_2
Traffic Profile	HEAVY
Expected Duration	30 seconds
Virtual Clients count	80
Request Throttling delay	0.05s

■ Host Performance Metrics Summary

Peak CPU Usage	95.1%
Peak Memory Usage	97.6%
Max Traffic Throughput	6 requests/sec
Max Concurrent Sockets	3 connections
Average Processing Latency	0.12 ms

■ Security Alerts Logged

[illegible]

RED	Low IP distribution entropy: 0.00 bits (Targeted flood indicator)	127.0.0.1
RED	Low IP distribution entropy: 0.00 bits (Targeted flood indicator)	127.0.0.1
RED	Low IP distribution entropy: 0.00 bits (Targeted flood indicator)	127.0.0.1
RED	Low IP distribution entropy: 0.00 bits (Targeted flood indicator)	127.0.0.1
RED	Low IP distribution entropy: 0.00 bits (Targeted flood indicator)	127.0.0.1
RED	Low IP distribution entropy: 0.00 bits (Targeted flood indicator)	127.0.0.1
RED	Low IP distribution entropy: 0.00 bits (Targeted flood indicator)	127.0.0.1
RED	Low IP distribution entropy: 0.00 bits (Targeted flood indicator)	127.0.0.1

■ ■ Mitigation Actions Deployed

Action Type	Target IP	Block Timer
BLOCK_IP	127.0.0.1	30s

■ Experiment Conclusion & Defensive Action Summary

Based on collected metrics, the platform has successfully simulated client connections. Under elevated loading (Medium/Heavy profiles), request frequency and latency spikes trigger the anomaly engines. In Automatic defense mode, the mitigation systems successfully logged rate-limit offenses and temporary blacklist overrides to SQLite database, blocking the targeted flows. This experiment confirms the effectiveness of multi-tiered rate limiting and signature alerts in DDoS mitigation.
